

## REISSUE APPLICATION DECLARATION BY THE INVENTOR

Docket Number (Optional)

VN169RT

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are stated below next to my name.

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is described and claimed in patent number 5,566,169, granted OCTOBER 15, 1996, and for which a reissue patent is sought on the invention entitled DATA COMMUNICATION NETWORK WITH TRANSFER PORT: CASCADE PORT AND/OR FRAME SYNCHRONIZING SIGNAL the specification of which

is attached hereto.

was filed on OCTOBER 15, 1998 as reissue application number 09/173,582 and was amended on \_\_\_\_\_ (if applicable)

I have reviewed and understand the contents of the above identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information which is material to patentability as defined in 37 CFR 1.56.

I verily believe the original patent to be wholly or partly inoperative or invalid, for the reasons described below. (Check all boxes that apply.)

- by reason of a defective specification or drawing.
- by reason of the patentee claiming more or less than he had the right to claim in the patent.
- by reason of other errors.

At least one error upon which reissue is based is described as follows:

By REASON OF CLAIMING ONLY CLAIMS 1-15, WHICH IS LESS THAN THE FULL RIGHT TO CLAIM IN THE PATENT, ADDITIONAL CLAIMS ARE ADDED, FOR EXAMPLE, CLAIM 16 IN THE REISSUE APPLICATION. THIS ERROR IS RELIED UPON TO SUPPORT THE REISSUE APPLICATION.

Under the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a valid OMB control number.

## (REISSUE APPLICATION DECLARATION BY THE INVENTOR, page 2)

Docket Number (Optional)

VN169RT

All errors corrected in this reissue application arose without any deceptive intention on the part of the applicant. As a named Inventor, I hereby appoint the following attorney(s) and/or agent(s) to prosecute this application and transact all business in the Patent and Trademark Office connected therewith.

Additional joint Inventors are named on separately numbered sheets attached hereto.

- 20        each said receive datapath including;  
          a deserializer configured to receive serial data from said  
          communications medium and output at least a portion  
          of said received serial data in parallel;  
25        means for selectively transmitting, in response to one of  
          said plurality of control signals, said data output by said  
          deserializer to said receive memory means;  
          each said transmit datapath including a serializer config-  
          ured to receive parallel data and output serial data.  
30        2. Apparatus, as claimed in claim 1, wherein each of said  
          receive memory means and said transmit memory means is  
          a buffer.  
          3. Apparatus, as claimed in claim 1, wherein said data  
          received over said communications medium includes status  
          data indicating at least a status of port activities.  
35        4. Apparatus, as claimed in claim 1, wherein said data  
          received over said communications medium comprises sta-  
          tus data including at least a status of interrupts of at least one  
          of said data stations and wherein each said receive datapath  
          includes a demultiplexer coupled between said communica-  
          tions path and said deserializer for diverting said status data  
40        to a first location prior to receipt of serial data in said  
          deserializer.  
          5. Apparatus, as claimed in claim 4, wherein said first  
          location comprises a first register.  
45        6. Apparatus, as claimed in claim 5, wherein said appa-  
          ratus is contained in a first network data station, coupled, via  
          said communications medium, to a plurality of other data  
          stations and wherein said first register stores status data from  
50        all said other data stations which are connected to said first  
          network data station.  
          7. Apparatus, as claimed in claim 1, wherein said transmit  
          datapath includes means for generating at least one pre-  
          determined data pattern for transmission onto said communica-  
          tions medium.  
55        8. Apparatus, as claimed in claim 7, wherein said means  
          for generating includes means for generating a plurality of  
          predetermined data patterns and means for selecting among  
          said plurality of data patterns in response to one of said  
          plurality of control signals.  
60        9. Apparatus, as claimed in claim 1, wherein said data  
          stations include at least first and second network data  
          stations, and said apparatus is contained in said first network  
          data station, which is coupled, via said communications  
          medium, to a first plurality of other data stations and also  
65        coupled, by said apparatus, via said communications  
          medium, to said second network data station which is  
          coupled to a second plurality of data stations and wherein:

TABLE X

| Signal Name                          | Description  |
|--------------------------------------|--|
| RXI+, RXI-, TXOP-, TXO-, TXO+, TXOP+ | Twisted pair receive inputs  |
| TXD                                  | Twisted pair transmit outputs  |
| TXD                                  | Transmit Data input. Serial NRZ data input from the controller.  |
| TXE                                  | Transmit Enable  |
| TXC                                  | Transmit Clock. A 10 Mhz clock derived from the 20 Mhz ECLK input.   |
| COL                                  | Collision Detect output. Generates an active high signal when the transceiver function of the physical layer portion detects a collision |
| RXD                                  | Receive Data Output  |
| RXC                                  | Receive clock  |
| CRS                                  | Carrier Sense  |
| ECRS                                 | Early carrier sense. In mixed configuration, this signal goes active when valid data has reached the input of the Ethernet receive FIFO  |
| LCLK                                 | Link Clock. Used by the transmit circuits as the bit level clock for data encoding upon the isochronous/ethernet link.                   |
| ECLK                                 | Ethernet clock. Used to encode data when the physical layer portion is operating in 10 Base T mode.                                      |
| IRFS                                 | Isochronous Receive frame synch. This output marks the beginning of a receive frame cycle.   |
| IRXD                                 | Isochronous receive data   |
| IRXE                                 | Isochronous receive enable   |
| IFR                                  | Isochronous Frame reference  |
| ITFS                                 | Isochronous transmit frame synch. Marks the beginning of a transmit frame cycle.   |
| ITXD                                 | Isochronous Transmit data  |

What is claimed is:

1. In a data communication network for communicating data between a plurality of data stations over a communications medium under control of a processor which outputs a plurality of control signals, apparatus comprising:
  - a receive memory means and a transmit memory means;
  - a receive datapath corresponding to each data station coupled between said communications medium and said receive memory means for providing at least some data received over said communications medium to said receive memory means;
  - a transmit datapath corresponding to each data station coupled between said transmit memory means and said communications medium for providing at least some data from said transmit memory means to said communications medium;

- 20 each said receive datapath including;  
a deserializer configured to receive serial data from said communications medium and output at least a portion of said received serial data in parallel;
- 25 means for selectively transmitting, in response to one of said plurality of control signals, said data output by said deserializer to said receive memory means;
- each said transmit datapath including a serializer configured to receive parallel data and output serial data.
- 30 2. Apparatus, as claimed in claim 1, wherein each of said receiver memory means and said transmit memory means is a buffer.
3. Apparatus, as claimed in claim 1, wherein said data received over said communications medium includes status data indicating at least a status of port activities.
- 35 4. Apparatus, as claimed in claim 1, wherein said data received over said communications medium comprises status data including at least a status of interrupts of at least one of said data stations and wherein each said receive datapath includes a demultiplexer coupled between said communications path and said deserializer for diverting said status data to a first location prior to receipt of serial data in said deserializer.
- 40 5. Apparatus, as claimed in claim 4, wherein said first location comprises a first register.
6. Apparatus, as claimed in claim 5, wherein said apparatus is contained in a first network data station, coupled, via said communications medium, to a plurality of other data stations and wherein said first register stores status data from all said other data stations which are connected to said first network data station.
- 45 7. Apparatus, as claimed in claim 1, wherein said transmit datapath includes means for generating at least one predetermined data pattern for transmission onto said communications medium.
8. Apparatus, as claimed in claim 7, wherein said means for generating includes means for generating a plurality of predetermined data patterns and means for selecting among said plurality of data patterns in response to one of said plurality of control signals.
- 55 9. Apparatus, as claimed in claim 1, wherein said data stations include at least first and second network data stations, and said apparatus is contained in said first network data station, which is coupled, via said communications medium, to a first plurality of other data stations and also coupled, by said apparatus, via said communications medium, to said second network data station which is coupled to a second plurality of data stations and wherein:
